

Koha implementation – system architecture

Koha implementation - integration

1. User driven transactions between Findit and Koha (check out/place hold, extend loan, payment): To read information from Koha it will be ILS-DI. To write to Koha – REST API (Should be available in next release).Alternatively ILS-DI
Another option is using reduced Koha OPAC/overlay in Findit for transactions between Findit and Koha
2. Harvest to Datastore of bibliographic records, holdings, items: OAI-PMH (REST API – maybe)
3. Patrons – create/update: HTTP API or cron job (patron import tool)
4. Self service terminals: SIP2
5. Info on loans, reservations, fines (My account/My library): ILS-DI. Or reduced Koha OPAC/overlay in Findit
6. Checkout/checkin: ILS-DI
